# **KOTHARI INTERNATIONAL SCHOOL**

### ACADEMIC PLAN

#### A LEVEL

## **SUBJECT:** PHYSICS **SESSION:** 2023-24

#### NAME OF THE TEACHER: VIPIN KUMAR

| MONTH              | ΤΟΡΙΟ                   | CONCEPT   | LEARNING OBJECTIVES   |
|--------------------|-------------------------|---|---|
| MARCH<br>(9 DAYS)  | CIRCULAR MOTION         | Describing circular motion<br>Angles in radians<br>Steady speed, changing velocity<br>Angular speed<br>Centripetal forces<br>Calculating acceleration and<br>force<br>The origins of centripetal forces     | In this chapter students will<br>learn how to:<br>Express angular<br>displacement in radians.<br>Solve problems using the<br>concept of angular speed<br>describe motion along a<br>circular path as due to a<br>perpendicular force that<br>causes a centripetal<br>acceleration.<br>Recall and use equations for<br>centripetal acceleration. |
| APRIL<br>(18 DAYS) | GRAVITATIONAL<br>FIELDS | Representing a gravitational<br>field<br>Gravitational field strength g<br>Energy in a gravitational field<br>Gravitational potential<br>Orbiting under gravity<br>The orbital period<br>Orbiting the Earth | In this chapter you will<br>learn how to:<br>Describe a gravitational<br>field as a field of force and<br>define gravitational field<br>strength g.   |

|  | Represent a gravitational field using field lines.   |
|--|--|
|  | Understand the meaning of<br>centre of mass and use the<br>concept in problems<br>involving uniform spheres.   |
|  | Recall and use Newton's law of gravitation.  |
|  | Solve problems involving<br>the gravitational field<br>strength of a uniform field<br>and the field of a point<br>mass understand how the<br>gravitational potential<br>energy,of two point masses<br>is a consequence of<br>gravitational potential<br>define and solve problems<br>involving gravitational<br>potential. |
|  | Analyse circular orbits in an<br>inverse square law field,<br>including geostationary<br>orbits.   |
|  |  |

| OSCILLATIONS | Free and forced oscillations    | In this chapter students will         |
|--------------|---------------------------------|---------------------------------------|
|              | Observing oscillations          | learn how to:                         |
|              | Describing oscillations         | Give examples of free and             |
|              | Simple harmonic motion          | forced oscillations.                  |
|              | Representing s.h.m. graphically |                                       |
|              | Frequency and angular           | Use appropriate                       |
|              | frequency                       | terminology to describe               |
|              | Equations of s.h.m.             | oscillations.                         |
|              | Energy changes in s.h.m.        |                                       |
|              | Damped oscillations             | Use the equation $a = -\omega^2 x$ to |
|              | Resonance                       | define simple harmonic                |
|              |                                 | motion (s.h.m.).                      |
|              |                                 |                                       |
|              |                                 | Recall and use equations for          |
|              |                                 | displacement and velocity in          |
|              |                                 | s.h.m.                                |
|              |                                 |                                       |
|              |                                 | Draw and use graphical                |
|              |                                 | representations of s.h.m.             |
|              |                                 | describe energy changes               |
|              |                                 | during s.h.m.                         |
|              |                                 |                                       |
|              |                                 | Recall and use , where E is           |
|              |                                 | the total energy of a system          |
|              |                                 | undergoing simple                     |
|              |                                 | harmonic motion                       |
|              |                                 | describe the effects of               |
|              |                                 | damping on oscillations and           |
|              |                                 | draw graphs showing these             |
|              |                                 | effects.                              |
|              |                                 |                                       |
|              |                                 |                                       |

|                 |   | Understand that resonance<br>involves a maximum<br>amplitude of oscillation.<br>Understand that resonance<br>occurs when an oscillating<br>system is forced to oscillate<br>at its natural frequency.   |
|-----------------|---|---|
| THERMAL PHYSICS | Changes of state<br>Energy changes<br>Internal energy<br>The meaning of temperature<br>Thermometers<br>Calculating energy changes | In this chapter students will<br>learn how to:<br>Relate a rise in temperature<br>of an object to internal<br>energy, the sum of the<br>random distribution of<br>kinetic and potential<br>energies of the molecules in<br>a system.<br>Recall and use the first law<br>of thermodynamics.<br>Calculate the work done<br>when the volume of a gas<br>changes at constant<br>pressure.<br>Measure temperature using<br>a physical property and<br>state examples of such |

|                  |             |   | Use the thermodynamic<br>scale of temperature, and<br>understand that the lowest<br>possible temperature<br>is zero kelvin and that this is<br>known as absolute zero.<br>Relate transfer of (thermal)<br>energy as being due to a<br>difference in temperature<br>and understand<br>thermal equilibrium.<br>Define and use specific heat<br>capacity and specific latent |
|------------------|-------------|---|---|
|                  |             |   | heat, and outline how these<br>quantities can be measured.  |
| MAY<br>(18 DAYS) | IDEAL GASES | Particles of a gas<br>Explaining pressure<br>Measuring gases<br>Boyle's law<br>Changing temperature<br>Ideal gas equation<br>Modelling gases: the kinetic<br>model<br>Temperature and molecular<br>kinetic energy | In this chapter students will<br>learn how to:<br>Measure amounts of a<br>substance in moles and find<br>the number of particles<br>using molar quantities.<br>Solve problems using the<br>equation of state pV = nRT<br>for an ideal gas.  |
|                  |             |   | Deduce a relationship<br>between pressure, volume<br>and the microscopic  |

|                            |  | properties of the molecules<br>of a gas, stating the<br>assumptions of the kinetic<br>theory of gases.<br>Relate the kinetic energy of<br>the molecules of a gas to its<br>temperature and calculate<br>root-mean-square speeds. |
|----------------------------|--|--|
| UNIFORM ELECTRIC<br>FIELDS | Attraction and repulsion<br>The concept of an electric field<br>Electric field strength<br>Force on a charge | In this chapter students will<br>learn how to:<br>Show an understanding of<br>the concept of an electric<br>field.   |
|                            |  | Define electric field strength<br>draw field lines to represent<br>an electric field.  |
|                            |  | Calculate the strength of a<br>uniform electric field<br>calculate the force on a<br>charge in a uniform electric<br>field.  |
|                            |  | Describe how charged<br>particles move in a uniform<br>electric field.   |

| JUNE              |               |  |   |
|-------------------|---------------|--|---|
| SUMMER VACATION   |               |  |   |
| JULY<br>(20 DAYS) | COULOMB'S LAW | Electric fields<br>Coulomb's law<br>Electric field strength for a<br>radial field<br>Electric potential<br>Gravitational and electric fields | In this chapter students will<br>learn how to:<br>Recall and use Coulomb's<br>law.<br>Calculate the field strength<br>for a point charge.   |
|                   |               |  | Recognise that for the<br>electric field strength for a<br>point outside a spherical<br>conductor, the charge on<br>the sphere may be<br>considered to be a point<br>charge at the centre of the<br>sphere. |
|                   |               |  | Define electric potential<br>calculate potential due to a<br>point charge.  |
|                   |               |  | Relate field strength to the<br>potential gradient<br>compare and contrast<br>electric and gravitational<br>fields.   |
|                   |               |  |   |

|  | CAPACITANCE | Capacitors in use<br>Energy stored in a capacitor<br>Capacitors in parallel<br>Capacitors in series<br>Comparing capacitors and<br>resistors<br>Capacitor networks<br>Charge and discharge of<br>capacitors | <ul> <li>In this chapter students will learn how to:</li> <li>Define capacitance and state its unit, the farad solve problems involving charge, voltage and capacitance.</li> <li>Deduce the electric potential energy stored in a capacitor from a potential—charge graph.</li> <li>Deduce and use formulae for the energy stored by a capacitor.</li> <li>Derive and use formulae for capacitances in series and parallel.</li> <li>Recognise and use graphs showing variation of potential difference, current and charge as a capacitor discharges.</li> <li>Recall and use the time constant for a capacitor—resistor circuit.</li> </ul> |
|--|-------------|---|--|
|--|-------------|---|--|

|                         |   | Use the equation for the<br>discharge of a capacitor<br>through a resistor.  |
|-------------------------|---|--|
| AND<br>ELECTROMAGNETISM | magnetic fields<br>Magnetic force<br>Magnetic flux density<br>Measuring magnetic flux density<br>Currents crossing fields<br>Forces between currents<br>Relating SI units<br>Comparing forces in magnetic,<br>electric and gravitational fields | In this chapter students will<br>learn how to:<br>Describe a magnetic field as<br>an example of a field of<br>force caused by moving<br>charges or permanent<br>magnets.<br>Use field lines to represent a<br>field and sketch various<br>patterns.<br>Determine the size and<br>direction of the force on a<br>current-carrying conductor<br>in a magnetic field.<br>Define magnetic flux density<br>and know how it can be<br>measured.<br>Explain the origin of the<br>forces between current-<br>carrying conductors and<br>find the direction of these<br>forces. |

| AUGUST<br>(19 DAYS) | MOTION OF CHARGED<br>PARTICLES | <ul> <li>Observing the force</li> <li>Orbiting charged particles</li> <li>Electric and magnetic fields</li> <li>The Hall effect</li> <li>Discovering the electron</li> </ul> | In this chapter you will<br>learn how to:<br>Determine the direction of<br>the force on a charge<br>moving in a magnetic field<br>recall and use F = BQv sinθ.<br>Describe the motion of a<br>charged particle moving in a<br>uniform magnetic field<br>perpendicular to the<br>direction of motion of the<br>particle.<br>Explain how electric and<br>magnetic fields can be used<br>in velocity selection<br>understand the origin of the<br>Hall voltage and derive and<br>use the expression.<br>Understand the use of a Hall<br>probe to measure magnetic<br>flux density. |
|---------------------|--------------------------------|--|---|
|                     | ELECTROMAGNETIC<br>INDUCTION   | Observing induction<br>Explaining electromagnetic<br>induction   | In this chapter you will<br>learn how to:   |

| Faraday's law of<br>electromagnetic induction<br>Lenz's law<br>Everyday examples of<br>electromagnetic induction | Define magnetic flux as the<br>product of the magnetic flux<br>density and the cross-<br>sectional area perpendicular<br>to the direction of the<br>magnetic flux density.<br>Recall and use understand<br>and use the concept of<br>magnetic flux linkage.<br>Understand and explain<br>experiments that<br>demonstrate:<br>that a changing magnetic<br>flux can induce an e.m.f. in<br>a circuit that the direction<br>of the induced e.m.f.<br>opposes the change<br>producing it the factors<br>affecting the magnitude of<br>the induced e.m.f.<br>Recall and use Faraday's<br>and Lenz's laws of<br>electromagnetic induction. |
|--|--|
|--|--|

| ALTERNATING<br>CURRENTS | Sinusoidal current<br>Alternating voltages<br>Power and alternating current<br>Rectification | In this chapter you will<br>learn how to:<br>Understand and use the<br>terms period, frequency and<br>peak value as applied to an<br>alternating current or<br>voltage use equations of the<br>form x = x0 sin ωt<br>representing a sinusoidally<br>alternating current or<br>voltage.<br>Recall and use the fact that<br>the mean power in a<br>resistive load is half the<br>maximum power for a<br>sinusoidal alternating |
|-------------------------|--|--|
|                         |  | current.<br>Distinguish between root-<br>mean-square (r.m.s.) and<br>peak values and recall and<br>use and for a sinusoidal<br>alternating current.<br>Distinguish graphically<br>between half-wave and full-<br>wave rectification explain<br>the use of a single diode for<br>the half-wave rectification<br>of an alternating current.  |

|                        |                                    |  | Explain the use of four<br>diodes (bridge rectifier) for<br>the full-wave rectification of<br>an alternating current<br>Analyse the effect of a single<br>capacitor in smoothing,<br>including the effect of the<br>value of capacitance and the<br>load resistance.   |
|------------------------|------------------------------------|--|--|
| SEPTEMBER<br>(22 DAYS) | QUANTUM PHYSICS<br>AND<br>REVISION | Modelling with particles and<br>waves<br>Particulate nature of light<br>The photoelectric effect<br>Threshold frequency and<br>wavelength<br>Photons have momentum too<br>Line spectra<br>Explaining the origin of line<br>spectra<br>Photon energies<br>The nature of light: waves or<br>particles?<br>Electron waves<br>Revisiting photons | In this chapter you will<br>learn how to:<br>Understand that<br>electromagnetic radiation<br>has a particulate nature<br>understand that a photon is<br>a quantum of<br>electromagnetic energy<br>recall and use E = hf.<br>Use the electronvolt (eV) as<br>a unit of energy.<br>Understand that a photon<br>has momentum and that the<br>momentum is given by<br>understand that<br>photoelectrons may be<br>emitted from a metal |

| surface when it is<br>illuminated by<br>electromagnetic radiation.<br>Understand and use the<br>terms threshold frequency<br>and threshold wavelength<br>explain photoelectric<br>emission in terms of photon<br>energy and work function<br>energy.<br>Recall and use<br>explain why the maximum<br>kinetic energy of<br>photoelectrons is<br>independent of intensity,<br>whereas the photoelectric<br>current is proportional to<br>intensity understand that<br>the photoelectric effect<br>provides evidence for a<br>particulate nature of<br>electromagnetic radiation,<br>while phenomena such as<br>interference and diffraction<br>provide evidence<br>for a wave nature.<br>Describe and interpret<br>mailitatively the evidence   |                            |
